### **Stationary Installation**

The separator is installed at a fixed location and assembled in such a way that all the supply and drainage pipes are tidied away to give a neat appearance. Because this is a permanent fixture, it can also be put to use immediately and it is efficient in terms of time and clean in use as a result.

### **Mobile Installation**

A quick and efficient way to use the manure separator at different locations. The perfect solution when you do not want to be constrained by a permanent placing.

### **Mechanical Sprinkler**

The processed dry manure can be spread by standard saw dust spreaders as biobedding. The process is labor-friendly and saves you a lot of time as a result.

### **Cow Comfort**

Cows find the biobedding very comfortable. It is a resilient bedding for sheds, so bare hooves are not an issue. Thanks to the hollow drain shaft, the biobedding is extra dry! Far less of it sticks to the udders as a result.

### **Manure Storage**

Because the solids are separated from the rest of the manure, they can be kept out of the manure pit and stored until they can be spread. As the solids contain more phosphate it is worth spreading them on fields that can most benefit from it. The solids are also very suitable for use on your own farm.

### **Screw Pump with Cutting Filter**

The big advantage of a cutting filter in the fertilizer supply is that long food residues are cut up and stones are caught by the cutting filter's stone trap. This prevents the vast majority of plant failures and also helps look after the screw pump.
